

AMAZING ADAPTATIONS: CAMOUFLAGE

Many animals have evolved to exhibit some form of camouflage, which is an adaptation that allows animals to blend in with certain aspects of their environment. Camouflage increases an animal's chance of survival by hiding it from predators. Alternately, camouflage is also used by some predators as a tool for hunting.

For this activity, campers will be coloring a frog, lizard, or turtle with any color pattern they would like (natural or colorful) - then their challenge is to create a scene where the animal uses its camouflage ability to blend in! Campers can use natural materials (leaves, flowers, twigs) or art materials (tissue paper, feathers, pom poms) or both to create their scene on paper!
